

# Analyzing Recorded Vocal Performances

Johanna Devaney

Assistant Professor of Music Theory and Cognition

School of Music

The Ohio State University

# **Introduction**

Motivations and challenges.

1

## **A brief history**

Quantitative approaches to performance analysis.

2

## **Extracting Performance Data**

MIDI-audio alignment for automatic analysis of recorded performances.

3

## **Experiments**

Studies of intonation in the singing voice.

4

## **Conclusions**

Summary and future directions.

5

# Introduction

Why study musical performance?

- ▶ **Performances convey musicians' interpretations**
- ▶ **Performances are what listeners actually hear**
- ▶ **Studying performance can help us gain insight into**
  - how an individual's performance practice evolves as they gain more experience
  - how performance practices evolve over time
- ▶ **Observing how performance practices relate to musical materials can help us develop models of “expressive” performance**

# Introduction

What do I mean by studying performance?

- ▶ **Using (live) recorded performances**
- ▶ **Measuring performance parameters**
  - timing
  - dynamics
  - **tuning**
  - timbre
- ▶ **Assessing relationship between performance of various parameters and musical materials**

## **Introduction**

Motivations and challenges.

1

## **A brief history**

Quantitative approaches to performance analysis.

2

## **Extracting Performance Data**

MIDI-audio alignment for automatic analysis of recorded performances.

3

## **Experiments**

# Experiments with Performers

## Overview

- ▶ Intonation in trained singers in the Western Art Music tradition
- ▶ Solo and small ensemble (2-4 voices)
- ▶ Various aspect of the work was done in collaboration with Dan Ellis (Columbia), Jason Hockman (McGill), Ichiro Fujinaga (McGill), Michael Mandel (Ohio State), Peter Schubert (McGill), and Jon Wild (McGill)

# Experiments with Performers

Why study the singing voice?

- ▶ In its most basic form singing is innate and universal
  - Training and enculturation refine specific practices of singing
- ▶ The voice is one of the most expressive instruments
- ▶ Singing research is complementary to speech research

# Prior Findings on Vocal Intonation

- ▶ **Schoen (1922) – accompanied solo singers**
  - less sharp when descending than when ascending
- ▶ **Prame (1997) – accompanied solo singers**
  - intonation deviated substantially, but not consistently, from equal temperament
- ▶ **Jers and Terström (2005) – 16-voice ensemble**
  - greater intonation dispersion at a faster tempo
  - ascending intervals were larger than descending intervals

# Prior Findings on Vocal Intonation

- ▶ **Vurma and Ross (2006) – solo singers**
  - ascending/descending semitones smaller than EQT
  - ascending/descending tritones and fifths larger than EQT
- ▶ **Howard (2007a, 2007b) – a cappella quartets**
  - used non-equal temperament with a tendency toward, though not full compliance with, Just Intonation
- ▶ **Vurma (2010) – 2-part singing against a synthesized lower voice**
  - singers' intonation did not change significantly when the synthesized voice was detuned

# Recording Set-Up

## ► Rooms

- CIRMMT Labs at McGill
- St Mathias Church, Montreal

## ► Microphones

- Solo singers and the entire ensembles were recorded with a pair of cardioid microphone
- Each ensemble singer was miked with a cardioid headband mic

## ► Recording Equipment

- Lab: Mac Pro
- Church: portable 16-track recorder

# Solo Singing

## Overview

- ▶ **Schubert's “Ave Maria”**
  - 3x a cappella & 3x accompanied
- ▶ **12 solo singers**
  - 6 non-professional singers: undergraduate vocal majors
  - 6 professional singers: possess at least one graduate-level degree in voice performance
- ▶ **Melodic semitones and whole tones analyzed**

# Solo Singing

## Significant trends

### ▶ **TUNING SYSTEMS**

- No strict adherence, on average smaller than equal temperament (more so for semitones than whole tones)

### ▶ **DIRECTION:**

- Ascending semitones were 7–8 cents larger on average than descending semitones

### ▶ **EFFECT OF TRAINING**

- Pros were more consistent with one another
- Pros' semitones were 6 cents larger on average
- Non-pros tended to compress leading tones
- Non-pros' accompanied semitones were 3 cents larger than *a cappella* semitones

# Three-Part Singing

## Overview

- ▶ **Chord progression by Giambattista Benedetti**
- ▶ **4 ensembles**
  - Ensemble 1 (lab): semi-professional alto, tenor, and bass singers who performed without a conductor - *pilot*
  - Ensemble 2 (lab): professional alto, tenor, and bass singers who performed with a conductor
  - Ensemble 3 (church): professional soprano, alto, and tenor singers who performed with a conductor
  - Ensemble 4 (church) professional alto, tenor, and bass singers who performed with a conductor
- ▶ **Melodic whole tones in M3 and P5 vertical contexts**

# Three-Part Singing

## Exercises

A musical score for a three-part singing exercise in G major (one sharp) and common time (C). The score consists of three staves: Treble, Treble with an 8va (octave) marking, and Bass. The music is divided into four measures by vertical dashed lines. The first measure is enclosed in a dashed box. The notes are as follows:

Measure	Treble	Treble 8va	Bass
1	G4, A4, B4, C5	G5, A5, B5, C6	G3, A3, B3, C4
2	A4, B4, C5, B4	A5, B5, C6, B5	F3, G3, A3, B3
3	A4, B4, C5, B4	A5, B5, C6, B5	F3, G3, A3, B3
4	A4, B4, C5, B4	A5, B5, C6, B5	F3, G3, A3, B3

A musical score showing the interval analysis for the first two measures of the exercise. The notes are the same as in the first block. Yellow double-headed arrows indicate the intervals between the first and second notes of each staff:

- P5** (Perfect Fifth) between G4 and B4 in the Treble staff.
- M3** (Major Third) between G5 and B5 in the Treble 8va staff.
- Interval between G3 and B3 in the Bass staff is also a **M3** (Major Third).

# Three-Part Singing

## Significant trends

- ▶ **TUNING SYSTEMS:** No strict adherence, generally closer to equal temperament
- ▶ **DIRECTION:** not significant
- ▶ **VERTICAL INTERVAL CONTEXT:** melodic whole tones sung over a P5 were 15 cents larger on average than those sung over a M3

# Four-Part Singing

## Overview

- ▶ **Exercises composed by Jonathan Wild and Peter Schubert and a piece by Praetorius**
- ▶ **3 ensembles**
  - Ensemble 1 (lab): semi-professional SATB ensemble who performed without a conductor - *pilot*
  - Ensemble 2 (lab): professional SATB ensemble who performed with a conductor
  - Ensemble 3 (church): professional SATB ensemble who performed with a conductor
- ▶ **Melodic semitones and whole tones in various vertical contexts**
- ▶ **Vertical intervals in cadential contexts**

# Four-Part Singing

Exercises by Wild and Schubert

Exercise 1-6, Soprano part. The notes are circled in the original image.

Exercise 7-12, Soprano part. The notes are circled in the original image.

Exercise 13-18, Soprano part. The notes are circled in the original image.

Exercise 1-6, Alto part.

Exercise 7-12, Alto part.

Exercise 13-18, Alto part.

# Four-Part Singing

Praetorius - Es ist ein Ros' ent sprungen

The musical score is presented in four systems, each with four staves (Soprano, Alto, Tenor, Bass). The key signature is one flat (F major/D minor) and the time signature is common time (C). The score is divided into three systems, with measures 7, 8, and 13 marked. Vertical lines connect notes across staves, and dashed boxes highlight specific vertical intervals labeled 'V' (Vocals) and 'vi' (viols).

**Vertical intervals in cadential contexts were significantly closer to Just Intonation than those in non-cadential contexts**

# Two-Part Singing

## Overview

- ▶ **Semitone pattern sung against a recorded version of the lower-line that was detuned in various ways at two pitch heights**
- ▶ **6 of 12 subjects (*analysis of remaining 6 subjects ongoing*)**
  - 3 non-professionals: amateur singers
  - 3 professionals: possess at least one graduate-level degree in voice performance
- ▶ **Melodic semitones in vertical m3, TT, P5, m6, and P8 contexts**

# Two-Part Singing

## Exercises

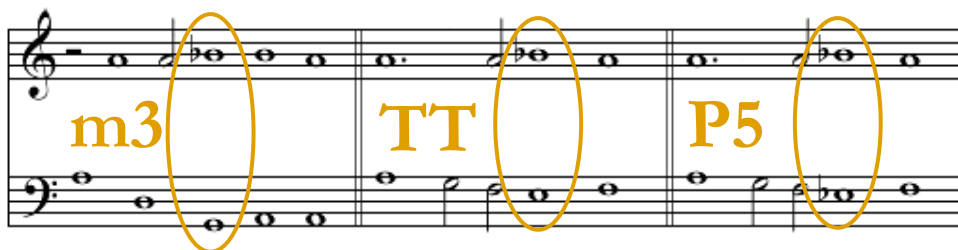

Staff 1: Four measures of two-part singing. The intervals are labeled in orange: m3, m6, P5, and m6. Each interval is circled in orange.

Staff 2: Four measures of two-part singing. The intervals are labeled in orange: m3, m3, P5, and m3. Each interval is circled in orange.

Staff 3: Four measures of two-part singing. The intervals are labeled in orange: m6, P5, m3, and P8. Each interval is circled in orange.

Staff 4: Three measures of two-part singing. The intervals are labeled in orange: m3, TT, and P5. Each interval is circled in orange.

# Two-Part Singing

## Significant trends

- ▶ **TUNINGS SYSTEM:** No strict adherence, on average smaller than equal temperament
- ▶ **DIRECTION:** Ascending semitones were 21 cents larger on average than descending semitones
- ▶ **EFFECT OF TRAINING:** Non-pros' semitones were 17 cents smaller on average than pros' semitones
- ▶ **DETUNING:** not significant
- ▶ **VERTICAL INTERVAL CONTEXT:** Semitones sung a perfect octave above the lower voice were 7 cents larger on average than those sung above other intervals
  - there were no significant differences for other intervals

# Summary of Results

Solo vs. ensemble singing

- ▶ A general trend of ascending intervals being larger than descending intervals was found in both solo and ensemble singing
- ▶ Results are variable for influence of specific vertical intervals on melodic intonation
- ▶ 3-part experiment – melodic intervals sung over a P5 versus M3 showed a significant difference
- ▶ 2-part experiment – melodic intervals only showed a significant difference when sung over a P8
- ▶ Detuning of accompaniment did not influence melodic intonation in the short exercises studied

# Summary of Results

## Comparison to earlier work

### ▶ **Schoen (1922) - solo**

- sharper than equal temperament 
- ascending intervals larger than descending intervals 

### ▶ **Prame (1997) - solo**

- deviation from equal temperament 

### ▶ **Jers and Ternstrom (2006) - ensemble**

- ascending intervals larger than descending intervals 

### ▶ **Vurma and Ross (2006) - solo**

- ascending/descending semitones smaller than EQT 

### ▶ **Howard (2007a, 200b) - ensemble**

- tendency towards Just Intonation  

### ▶ **Vurma (2010) - 2-part with synthesized lower voice**

- singers' intonation did not change significantly when the synthesized voice was detuned 

## **Introduction**

Motivations and challenges.

1

## **A brief history**

Quantitative approaches to performance analysis.

2

## **Extracting Performance Data**

MIDI-audio alignment for automatic analysis of recorded performances.

# Summary

Where we have been

## ► This talk has

- provided a brief overview of the history of quantitative performance analysis
- discussed some of the challenges of automatically extracting performance data from recordings
- summarized some of my recent work on vocal intonation practices in the western art music tradition

# Future Work

Where I am going

- ▶ **More contextualized experiments**
  - such as studying existing recordings of a singer performing the same piece at different points in their career
- ▶ **Developing more robust tools for automatic extraction of performance data from recordings**
  - making the current tools more reliable and more accessible to other researchers
- ▶ **Developing methods for making statistical comparison between performances**

# Acknowledgements
